An introduction to Git for teams

CMT501

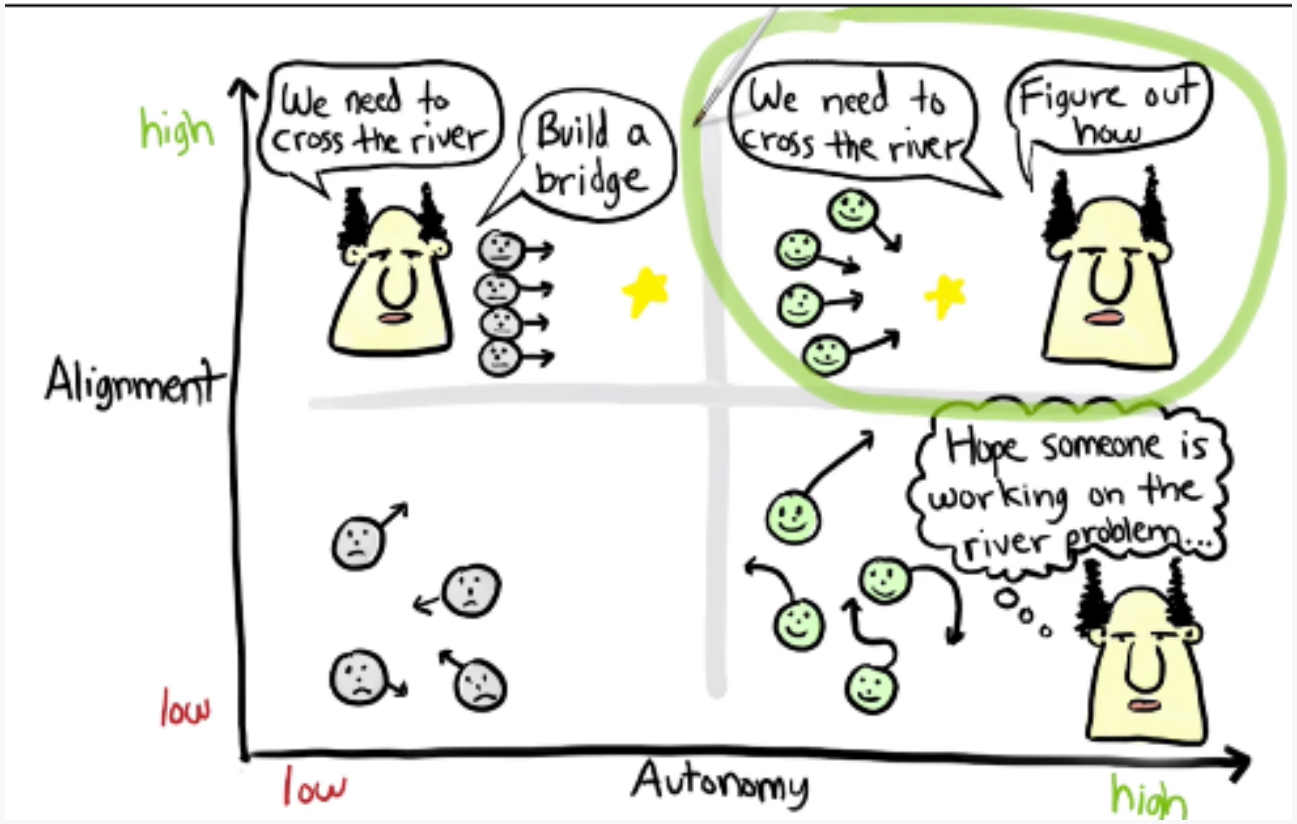

Module leader: Carl Jones

Previously:
Managing yourself to play well in a team

- Applying control to your work
- Recording your thoughts as you go
- Enabling options
- Having a backup
- Enabling feedback loops

What's needed in a team?

- Autonomy
- Alignment
- Shared understanding
- Shared values
- Adaptation

From "Spotify Engineering Culture"

Set a goal, bring it closer

- At the start of a project, you are at your most ignorant.
- Optimise your work for learning to reduce that ignorance.
- You will accelerate and become more accurate.

- Sometimes you need to balance against delivery.

- Build minimal viable products to learn…
  - …and be prepared to pivot if wrong

Work from a list

- Once you have a goal, produce a list of work items needed to achieve the goal.
- These could be user stories that need to be implemented.
- Allocate the work in priority order.
- Ideally, make the work items of a similar size (small).

Coordinate often

- Make sure that you all know what others are doing.
- Don’t start new work without evaluating work-in-progress.
- Review and share understanding…
  - More than just what. Think about the how and why.
  - Decisions taken. Benefits and consequences expected.

Maintain a team version

- Always have a releasable version of code ready.
- Treat that version at precious.
- Big changes can compromise that version…so stay small.

How can we do all this in Gitlab?

- Work items
- Milestones
- Branches and workflows
  - Merge requests

Project

- In teams…
- Create an eVoting system based on D’Hondt (or any voting system you like)
- Standing Data input (seats, candidates, parties, voters)
- Capture votes
- Calculate winners
- Visualise/report results

CARDIFF UNIVERSITY
PRIFYSGOL CAERDYDD

Live in Gitlab

- Issue boards
- Creating issues
- Branches from issues
- Merge requests
- Using Gitlab as the central coordinator
